

UTILIZAÇÃO DO ARDUINO PARA LIGAR LEDs E RECEBER SINAL DE SENSORES

Ligando o LED

Hardware Arduino

ground (terra)

Conexão
USB

ground (terra)

Componentes

Figura 4 – Exemplos de Led

Ligação Hardware

Software

```
void setup() {  
  // inicializa o pino digital 13 como Saída.  
  pinMode(13, OUTPUT);  
}  
  
void loop() {  
  digitalWrite(13, HIGH);  // ligar o LED  
  delay(1000);             // esperar por 1 segundo  
  digitalWrite(13, LOW);   // Desligar o LED  
  delay(1000);             // esperar por 1 segundo  
}
```

Hardware Arduino

ground (terra)

Conexão
USB

ground (terra)

Componentes

Ligação

Software

```
void setup()
{
  pinMode(sensor_temp, INPUT);
  Serial.begin(9600);
}

void loop()
{
  //Leitura e converção da temperatura
  analog_lido = analogRead(sensor_temp);
  temp = ((0.488 * analog_lido) - 49.76);

  Serial.println("Dados Bruto: ");
  Serial.println(analog_lido);
  Serial.println("Temperatura: ");
  Serial.println(temp);
}
```

EXERCÍCIO
